

InterviewFlow

Full-Stack Interview Management Application

TECH STACK

React + Vite

Express.js

Supabase (Auth + DB)

Node.js

Project Overview

InterviewFlow is a role-based interview management platform that streamlines the entire interview lifecycle — from scheduling and question management to answer submission and evaluation — across three distinct user roles.

Modules

1. Admin Module

- Manage users and assign roles (Admin / Interviewer / Candidate)
- Schedule interviews with title, description, candidate, interviewer, date & duration
- Add questions to any interview
- View reports and metrics across all interviews

2. Interviewer Module

- View interviews assigned to them
- Add or manage questions for their interviews
- Review candidate submissions and provide ratings & feedback
- Update interview status to "reviewed"

3. Candidate Module

- View interviews assigned to them
- Read questions for each interview
- Submit answers to questions
- Track submission status

Application Workflow

1

Authentication

User signs up / logs in via Supabase Auth. A JWT access token is issued and stored on the frontend.

2

Token Attachment

Every API call from the frontend (src/lib/api.js) attaches the token as Authorization: Bearer <token>.

3

Backend Verification

Express middleware (server/middleware/auth.js) validates the token with Supabase and loads the user profile + role.

4

Role-Based Routing

Routes check req.profile.role and allow or deny access. Admin can do everything; Interviewers and Candidates see only their data.

Database Operations

The Supabase Admin client (service role key, backend-only) performs all DB reads/writes on profiles, interviews, questions, and submissions tables.

Frontend Rendering

React reads the role from the session and renders the matching module UI (Admin / Interviewer / Candidate dashboard).

Data Entities (Database Tables)

profiles

id, full_name, email, role

interviews

id, title, description, candidate_id, interviewer_id, scheduled_at, duration_minutes, status, rating, feedback, created_at

questions

id, interview_id, prompt, type, position

submissions

id, interview_id, question_id, candidate_id, answer
